PG&E EXPECTS SLIGHTLY ABOVE NORMAL SUMMER WATER LEVELS AT LAKE ALMANOR, BUCKS LAKE

CHESTER, Calif. —Pacific Gas and Electric Company (PG&E) announced today that Lake Almanor and Bucks Lake water levels are projected to be slightly above normal this summer thanks to strong late-season precipitation.

PG&E announced the lake level projections today at the 2105 Lake Level Committee meeting in Chico, which is held most years to review and discuss PG&E's planned water operations for Lake Almanor and Bucks Lake for the remainder of the year. The committee name refers to Federal Energy Regulatory Commission (FERC) Project no. 2105, which is the license number for PG&E's Upper North Fork of the Feather River Hydroelectric Project.

Kevin Richards, a hydrologist in PG&E's power generation department, reported PG&E plans its operations to balance recreation, the environment, electric power generation and other needs. Despite below average precipitation for the northern Sierra Nevada and southern Cascades mountain ranges, enough rain and snow fell during March and April that Lake Almanor is expected to be about two feet higher than normal this summer.

Total precipitation for the season to date in the Lake Almanor basin is at 85 percent of average, and the spring runoff is forecast to be 72 percent of average, Richards reported.

This year, based on current data, a moderate summer electrical demand, and historical modeling, PG&E projects Lake Almanor levels will reach approximately 4,491 feet elevation by July 4, which is about three feet higher than normal for that date. The level is projected to be approximately 4,485 feet by Labor Day.

For Bucks Lake, levels are also projected to be slightly higher than normal, remaining above 5,154 feet elevation through July 4, which is about one foot higher than normal for that date. The level is projected to be approximately 5,142 feet by Labor Day.

Lake Almanor receives much of its water from volcanic aquifers in the Southern Cascade Mountain Range which release a steady year-round flow of water from springs. Bucks Lake on the other hand is in the Sierra Nevada Mountain Range and largely relies on surface runoff from the current season.

PG&E expects Butt Valley Reservoir to be within normal operating range this summer.

PG&E encourages the public to take appropriate safety precautions when recreating in and near water:

- Obey all warning signs and restrictive buoys while swimming or boating.

- Use the “buddy system.” Never fish, swim, boat or raft alone.
- Don’t dive or jump into unfamiliar water. Shallow water or submerged trees or rocks could cause serious injury.

About PG&E

Pacific Gas and Electric Company, a subsidiary of [PG&E Corporation](#) (NYSE:PCG), is one of the largest combined natural gas and electric energy company in the United States. Based in San Francisco, with more than 20,000 employees, the company delivers some of the nation’s cleanest energy to 15 million people in Northern and Central California.
